

Do you know certainly of any locality for *Schrankia*
uncinata east of the Mississippi, within my limits?
Do you know of any veinless species with such
long and slender legumes as Torrey ascribes to his
S. angustata? I do not of either. But I have a new
one from S. Fla with just such legumes, but with
the veiny pinnules of *S. uncinata*. So we have four—
two veiny, and two veinless, counting our *brachycarpa*
a good species, as it is. My new one would be
S. leptocarpa DC. if that had veiny leaves. Have
you that in the Herbarium? Always yours
J. W. H. S.
